

//Workflow of Project:

Role Dependencies + notes:

- Same embedding model everywhere. Role 1 (documents) and Role 3 (questions) must use the *same* model, or the vectors aren't comparable.
- Each role for now should build against fake data until we can connect the project together
- We must figure out how role 1 will format the info/embeddings for the document before parsing

```
{
  "text": "If a margin call is issued, the client must deposit funds within 3 days.",
  "source_document": "Fidelity_Margin_Rules_2026.pdf",
  "page_number": 12,
  "embedding": [0.12, -0.45, 0.88, ...]
}
```

```
struct DocumentChunk {
  std::string text;
  std::string source_document; // You are holding onto Role 1's sticky note
  int page_number;           // You are holding onto Role 1's sticky note
  std::vector<float> embedding;
};
```
